

In [1]: *#1. Pre-defined Variables*

```
In [2]: num1 = 11 #Here we define the variables in program
num2 = 99

print("The sum of two numbers is ", num1 + num2)
```

The sum of two numbers is 110

```
In [3]: num1 = 11
num2 = 99
sum = num1 + num2 #If we created variable named as Sum
print("The sum of two numbers is ", sum)
```

The sum of two numbers is 110

In [4]: *#2. User-input*

```
In [5]: num1 = float(input("Enter the number: ")) #We use float because the user can add decim
num2 = float(input("Enter the number: "))

sum = num1+num2
print("The sum of two numbers is ", sum)
```

Enter the number: 11

Enter the number: 77

The sum of two numbers is 88.0
